

Package: cisp (via r-universe)

November 21, 2024

Title A Correlation Indicator Based on Spatial Patterns

Version 0.2.0

Description Use the spatial association marginal contributions derived from spatial stratified heterogeneity to capture the degree of correlation between spatial patterns.

spc	<i>spatial pattern correlation</i>
-----	------------------------------------

Description

spatial pattern correlation

Usage

```
spc(
  data,
  overlay = "and",
  discnum = 3:8,
  minsize = 1,
  strategy = 2L,
  increase_rate = 0.05,
  cores = 1
)
```

Arguments

data	A <code>data.frame</code> , <code>tibble</code> or <code>sf</code> object of observation data.
overlay	(optional) Spatial overlay method. One of <code>and</code> , <code>or</code> , <code>intersection</code> . Default is <code>and</code> .
discnum	A numeric vector of discretized classes of columns that need to be discretized. Default all <code>discvar</code> use <code>3:8</code> .
minsize	(optional) The min size of each discretization group. Default all use <code>1</code> .
strategy	(optional) Optimal discretization strategy. When <code>strategy</code> is <code>1L</code> , choose the highest q-statistics to determinate optimal spatial data discretization parameters. When <code>strategy</code> is <code>2L</code> , The optimal discrete parameters of spatial data are selected by combining LOESS model.
increase_rate	(optional) The critical increase rate of the number of discretization. Default is <code>5%</code> .
cores	(optional) Positive integer (default is <code>1</code>). When <code>cores</code> are greater than <code>1</code> , use multi-core parallel computing.

Value

A list.

`correlation_tbl` A `tibble` with power of spatial pattern correlation

`correlation_mat` A matrix with power of spatial pattern correlation

Examples

```
## Not run:
## The following code needs to configure the Python environment to run:
sim1 = sf::st_as_sf(gdverse::sim, coords = c('lo', 'la'))
g = spc(sim1, discnum = 3:6, cores = 1)
g

## End(Not run)
```

ssh_marginalcontri *spatial association marginal contributions derived from spatial stratified heterogeneity*

Description

spatial association marginal contributions derived from spatial stratified heterogeneity

Usage

```
ssh_marginalcontri(formula, data, overlay = "and", cores = 1)
```

Arguments

formula	A formula of ISP model.
data	A <code>data.frame</code> , <code>tibble</code> or <code>sf</code> object of observation data.
overlay	(optional) Spatial overlay method. One of <code>and</code> , <code>or</code> , <code>intersection</code> . Default is <code>and</code> .
cores	(optional) Positive integer (default is 1). When cores are greater than 1, use multi-core parallel computing.

Value

A list.

`pd` robust power of determinants

`spd` shap power of determinants

`determination` determination of the optimal interaction of variables

Examples

```
NTDs1 = sf::st_as_sf(gdverse::NTDs, coords = c('X', 'Y'))
g = ssh_marginalcontri(incidence ~ ., data = NTDs1, cores = 1)
g
```
